English Assignments (2021-22)

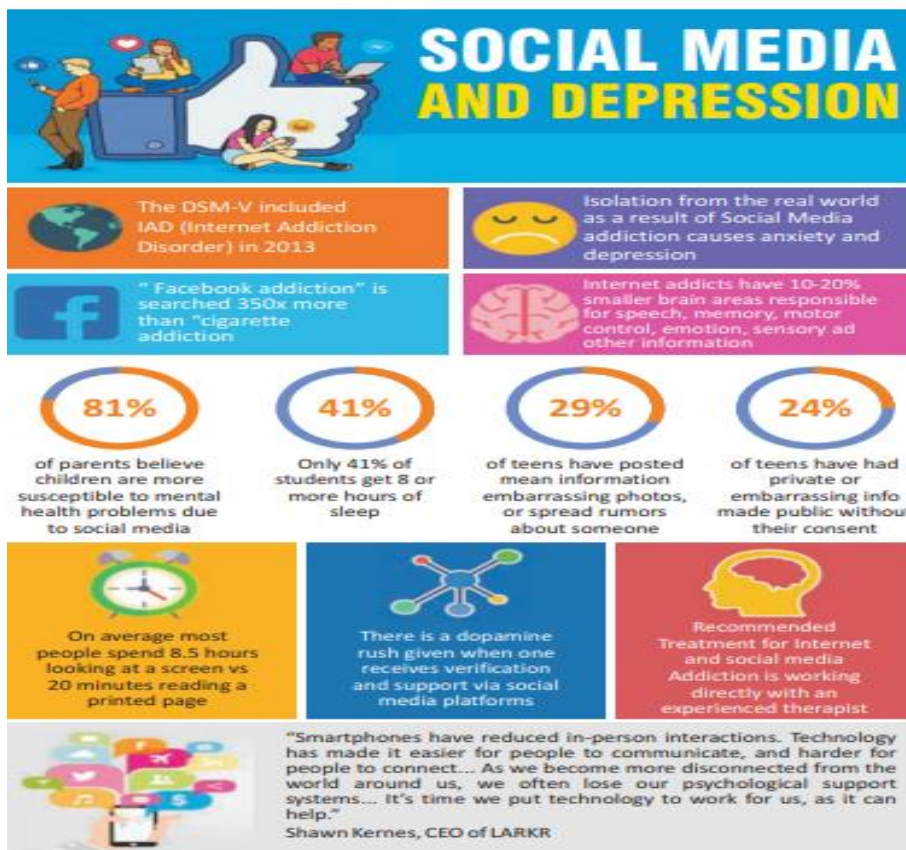

Q.1. Read the passage given below.

Is using social media making our kids unhappy? Evidence is mounting that there is a link between social media and depression. In several recent studies, teenage and young adult users who spend the most time on Instagram, Facebook and other platforms were shown to have a substantially (from 13 to 66 percent) higher rate of reported depression than those who spent the least time.

Does that mean that Instagram and Facebook are actually *causing* depression? These studies show a correlation, not causation. But it's worth a serious look at how social media could be affecting teenagers and young adults negatively. One reason the correlation seems more than coincidental is that an increase in depression occurred in tandem with the rise in smartphone use.

A 2017 study of over half a million eighth through 12th graders found that the number exhibiting high levels of depressive symptoms increased by 33 percent between 2010 and 2015. In the same period, the suicide rate for girls in that age group increased by 65 percent.

Smartphones were introduced in 2007, and by 2015 fully 92 percent of teens and young adults owned a smartphone. Over that same time period there was a sharp spike in reports of students seeking help at college and university counselling centres, principally for depression and anxiety. Visits jumped 30 percent between 2010 and 2015

One of the biggest differences in the lives of current teenagers and young adults, compared to earlier generations, is that they spend much less time connecting with their peers in person and more time connecting electronically, principally through social media.

Some experts see the rise in depression as evidence that the connections social media users form electronically are less emotionally satisfying, leaving them feeling socially isolated.

"The less you are connected with human beings in a deep, empathic way, the less you're really getting the benefits of a social interaction," points out Alexandra Hamlet, a clinical psychologist at the Child Mind Institute. "The more superficial it is, the less likely it's going to cause you to feel connected, which is something we all need."

Based on the analysis of the given passage and visual, answer the following questions:

- 81% of parents believe that children are more susceptible to mental health problems due to social media. Why do you think they believe so?
 - Social media spreads rumours, makes embarrassing comments, damages reputation, emits negative values and makes personal information public.
